Result for B_s to J/ψ ϕ at CDF

$B_s \rightarrow J/\psi \phi$ (CDF)

G. Giurgiu, ICHEP-2010,
CDF Public note 10206

- 5.2 fb⁻¹ of data analyzed
- ~6500 signal events
- Same side flavour tagging calibrated in data
- Strong phases are free
- S wave included in the fit
 $< 6.5\%$ at 95% CL

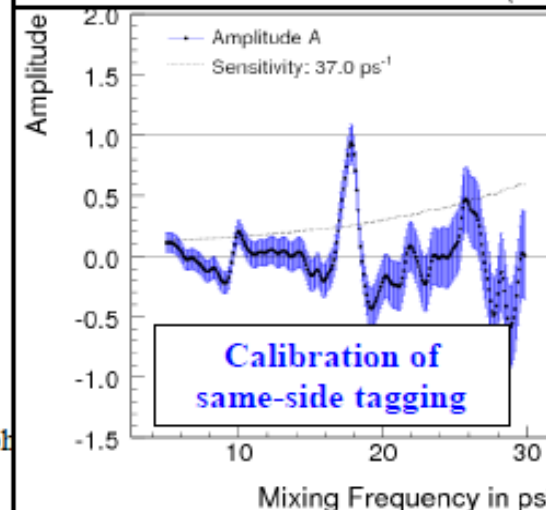

$$\tau_s = 1.529 \pm 0.025 \text{ (stat)} \pm 0.012 \text{ (syst)} \text{ ps}$$

$$\Delta\Gamma_s = 0.075 \pm 0.035 \text{ (stat)} \pm 0.01 \text{ (syst)} \text{ ps}^{-1}$$

Analysis : B_s to $J/\psi \phi$

Measurement of β_s and $\Delta\Gamma$

Method of Analysis

- 1) Reconstruction of the $B_s \rightarrow J/\psi \phi$ mode
 - Kinematic reconstruction of the final state
 - Identification of the B_s flavour (b-tagging)

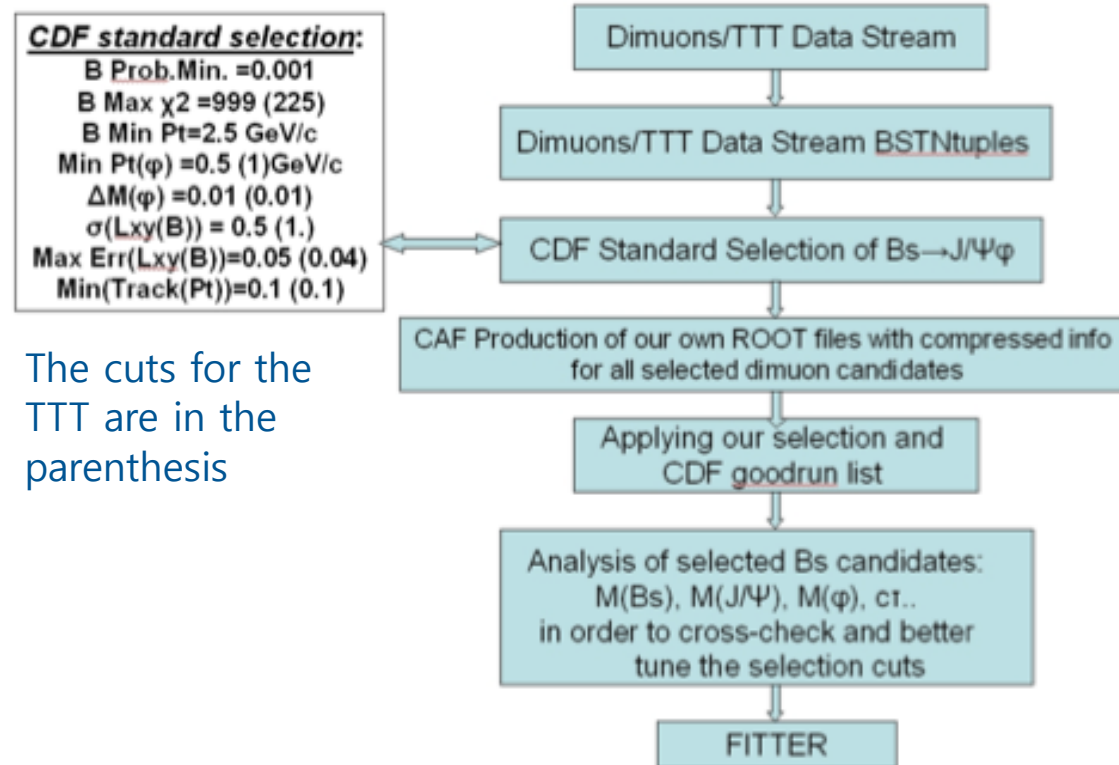

- 1) Unbinned maximum likelihood fit for the determination of the $\beta_s, \Delta\Gamma$

$$L = \prod_{i=0 \dots N} (f_s P(S) + (1 - f_s) P(B)) \quad L = \underbrace{f_s P(m|S)}_{\text{Mass term}} \underbrace{P(ct, \vartheta, \psi, \phi | \sigma_{ct}, S)}_{\text{CP angular analysis}} \underbrace{P(\sigma_{ct})}_{\text{ct error}} +$$

Unbinned likelihood function: generic formulation $+ (1 - f_s) \underbrace{P(m|B)}_{\text{mass term}} \underbrace{P(\vartheta, \psi, \phi | B)}_{\text{Angular distribution}} \underbrace{P(ct | \sigma_{ct}) P(\sigma_{ct})}_{\text{Decay}}$

- 1) Mass term:
 - Signal: 1 gaussian
 - Background: 1 exponentia
- 2) CP angular analysis and angular distributions
- 3) Ct error: 2 Gamma functions
- 4) Background Ct distribution:
 - 1 smeared and shifted exponential (TTT)
 - 1 prompt gaussian + 2 exponential (di-muon)

Flow DIAGRAM

This flow diagram summarizes the procedure used for the data selection and analysis for both the two track trigger (TTT) and the dimuon trigger streams.

The selection follows into two stages.

First, corresponds to applying the so called standard CDF pre-selection for both data streams.

Selection cuts defining a $B_s \rightarrow J/\psi\phi$ candidates

Second, refines the selection of B_s candidates on both data streams with slightly different cuts and still keeping rather loose requirements.

TTT	DIM
$5.24 < \text{Mass}(B_s^0) < 5.4 \text{ GeV}/c^2$	$5.24 < \text{Mass}(B_s^0) < 5.48 \text{ GeV}/c^2$
$2.95 < \text{Mass}(J/\psi) < 3.25 \text{ GeV}/c^2$	$3.05 < \text{Mass}(J/\psi) < 3.15 \text{ GeV}/c^2$
$P_t(J/\psi) > 2.00 \text{ GeV}/c$	$1.01 < \text{Mass}(\phi) < 1.03 \text{ GeV}/c^2$
$P_t(\phi) > 1.36 \text{ GeV}/c$	$P_t(B_s^0) > 2.50 \text{ GeV}/c$
At least one identified muon	$P_t(K) > 1.00 \text{ GeV}/c$
$\chi_{xy}^2(B_s) < 18$	
$d_0(B_s) < 65 \mu m$	

Table : summarizes the selection cuts defining a $B_s \rightarrow J/\psi\phi$ candidate for both data streams in our analysis

Integrated Luminosity

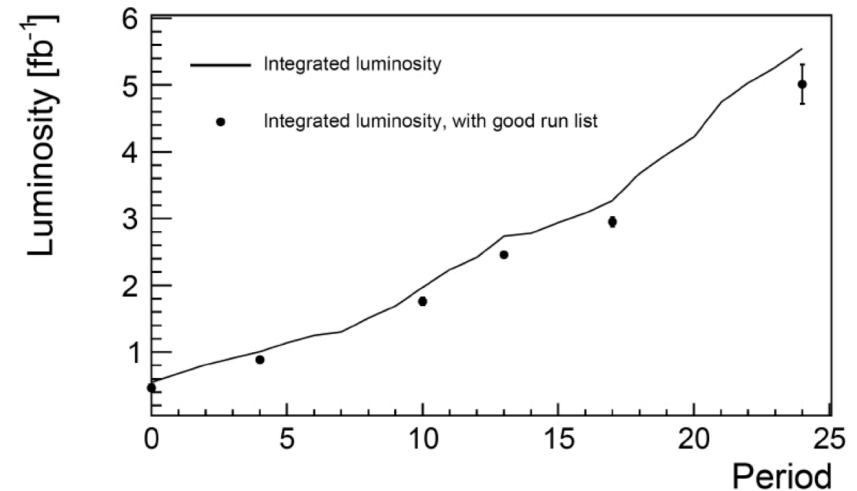

The data considered correspond to the time range between the beginning of Run II and Oct. 25th 2009 (period 0 to 26). The total recorder integrated luminosity by CDF from periods 0 to 26 is 4.2 fb^{-1} .

The goodrun list version 32, as created on March 12th 2010 is applied here and the total integrated luminosity after applying the goodrun list is 5.0187 fb^{-1} .

Delivered and acquired luminosity at the CDF experiment (period 0-24)

CDF integrated luminosity before (full line) and after (points) the application of the goodrun list (period 0-24)

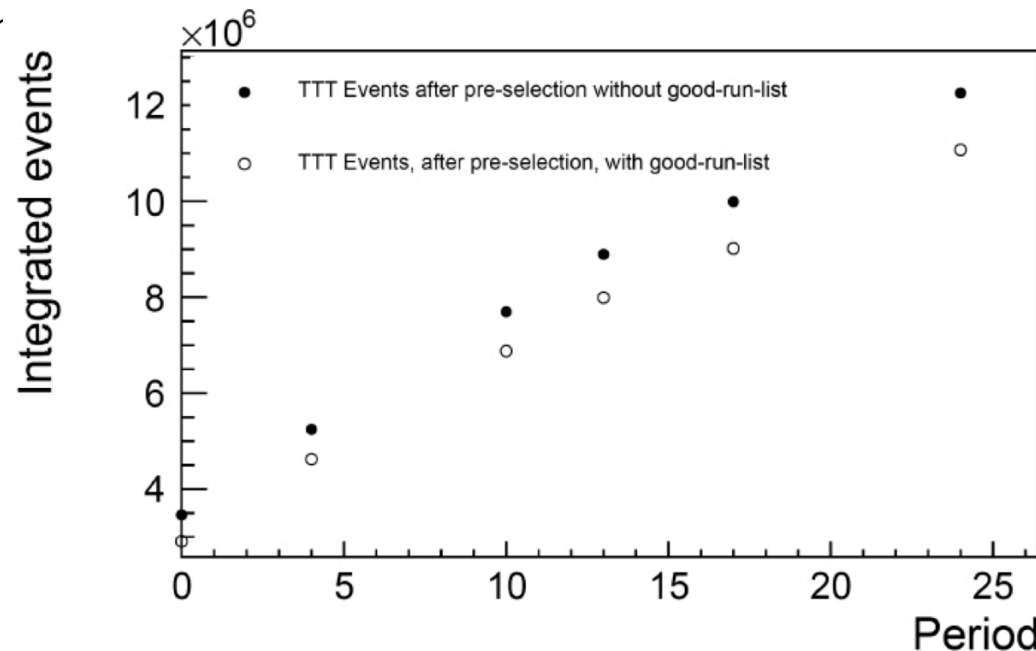

Number of events when applying goodrun list

Numbers of events per run periods from run 0 to run 24, for the TTT data stream after applying the pre-selection and without applying or applying the goodrun list.

A total of 1.26×10^7 reconstructed $J/\Psi\phi$ candidates are retained by this pre-selection in the TTT data stream BstNtuples, (period 0-26).

This total number of events is reduced by applying the goodrun list.
(~ 6%)

$B_s \rightarrow J/\Psi\phi$ reconstructed events in the TTT BstNtuples after pre-selection without (black dots) and with (white dots) applying the goodrun list (period 0-24)

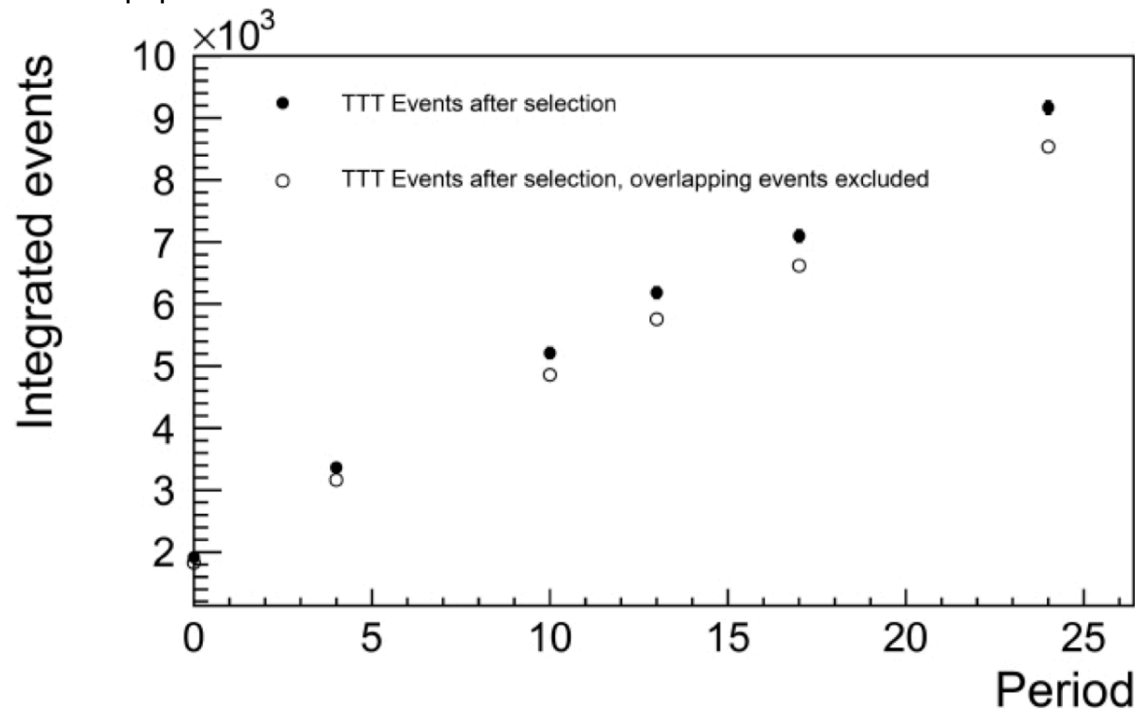

Selection Cuts

This figure shows the number of $B_s \rightarrow J/\psi\phi$ events after this selection by run period as applied to the TTT data stream (black dots).

The corresponding numbers excluding the overlapping events are also shown (white dots).

The total number of $B_s \rightarrow J/\psi\phi$ events after the selection cuts in the TTT data streams is 9169 and 70168 in the dimuon data stream. After excluding the overlapping events between the two streams we are left with 8538 $B_s \rightarrow J/\psi\phi$ events.

Selection Cuts

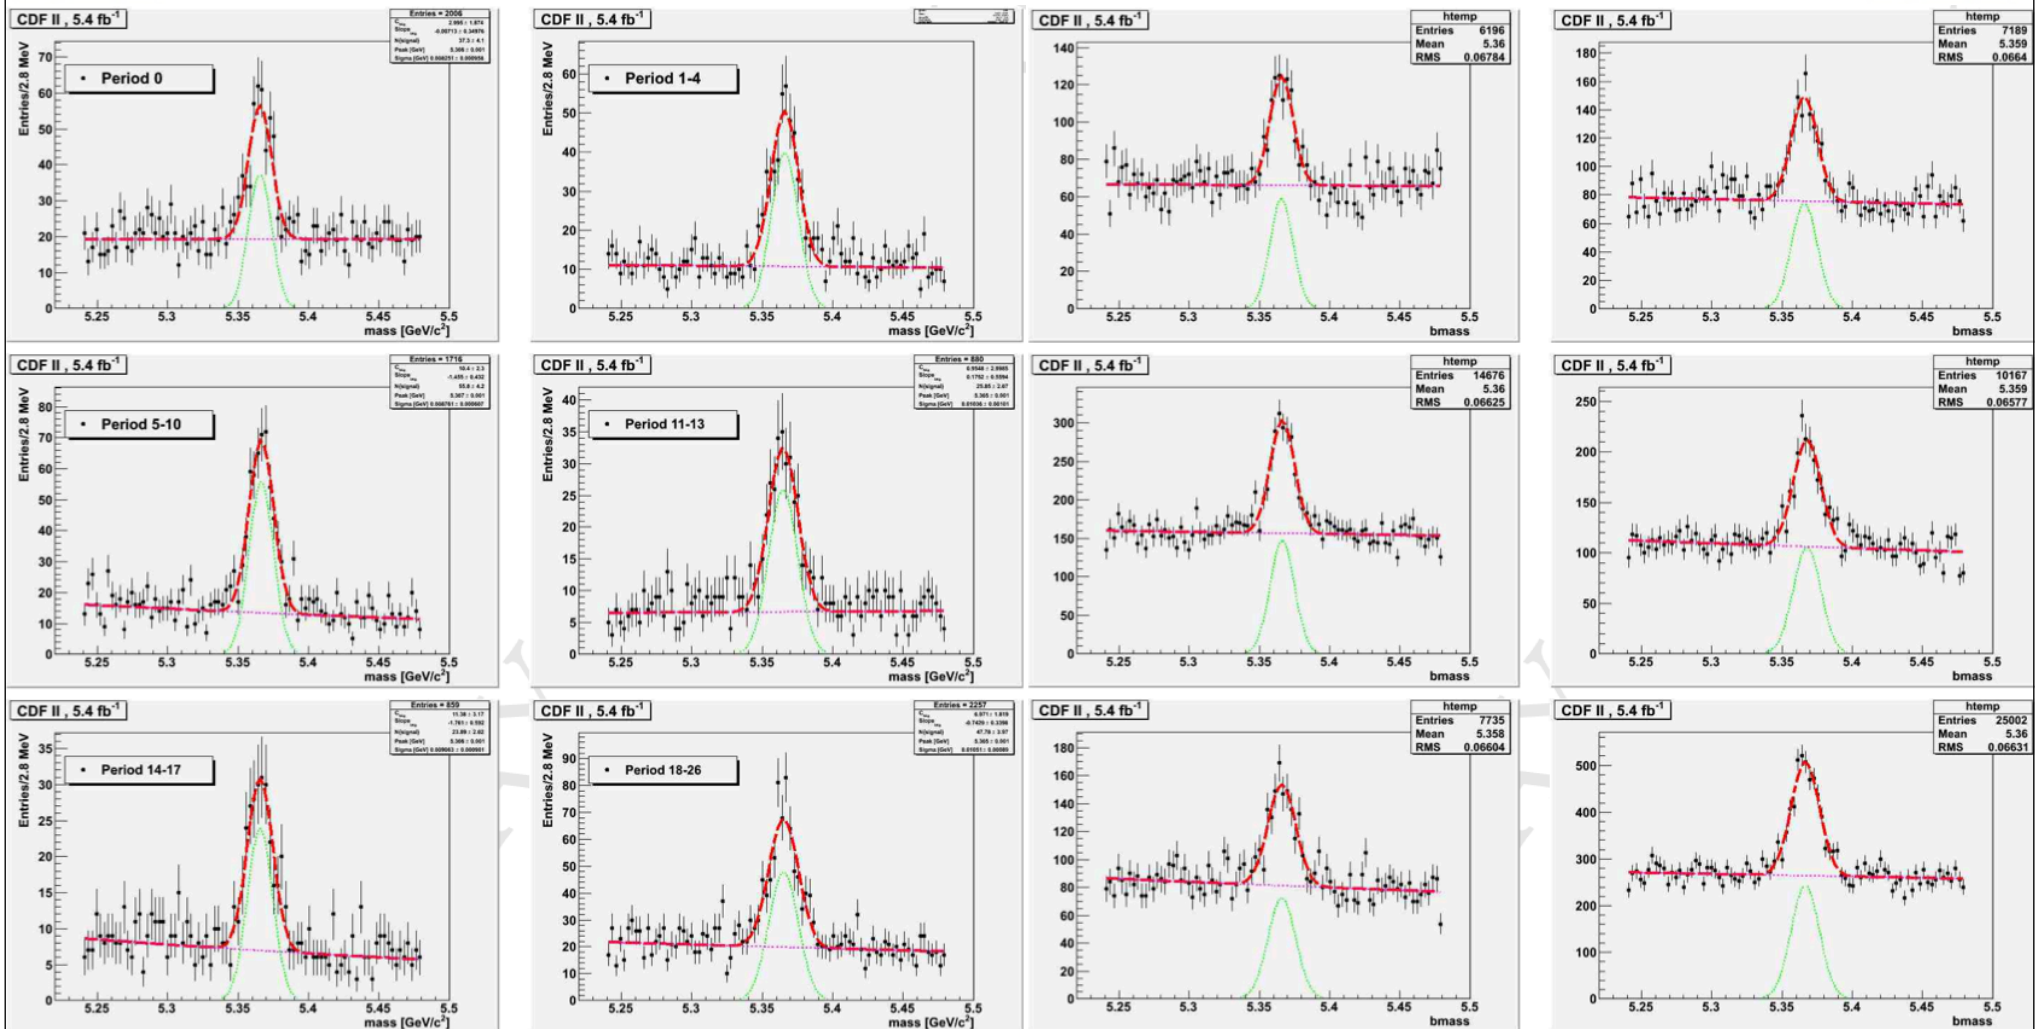

Period	Events preselection	Events (Preselection+goodrun)	Events (B_s^0 cuts)	Overlap events
0	3,463,653	2,906,425	2,009	93 (4.6%)
1 - 4	1,781,239	1,719,045	1,391	111 (8.0%)
5 - 10	2,451,679	2,252,714	1,803	164 (9.1%)
11 - 13	1,199,567	1,112,792	931	80 (8.6%)
14 - 17	1,094,714	1,025,521	874	54 (6.2%)
18 - 26	2,575,462	2,055,105	2,330	187 (8.0%)
Total	12,566,314	11,071,602	9,338	689 (7.4%)

Details of the number of events in the TTT data stream
per run period at the various selection stages (period
0-26)

Run Period	Selected B_s^0 events (entries) from Dimuons without goodrun list selection	Selected B_s^0 events (entries) from Dimuons with goodrun list selection
0	7,720	6,196
1 - 4	9,263	7,189
5 - 10	15,808	14,667
11 - 13	10,535	10,167
14 - 17	8,336	7,699
18 - 26	25,002	23,717
Total	75,379	70,929

Number of $B_s \rightarrow J/\psi\phi$ entries from the dimuon data stream after
selection and without or with applying the goodrun list and without
excluding the overlapping events and excluded overlaps (period 0-26)

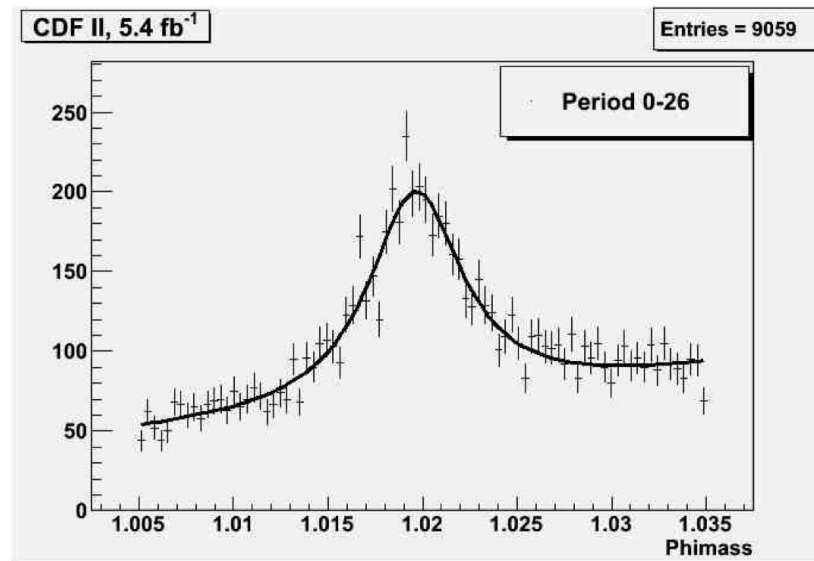

Bs Mass Spectrum Plots for TTT and Dimuon

Effects of L_{xy} cuts on the B_s Sample

	Signal Events (S)	Background (B)	$S\sqrt{S+B}$
No cuts on L_{xy}	1889 ± 142	1634	31.8
$L_{xy} > 100\mu m$	1846 ± 128	971	34.8
$L_{xy} > 150\mu m$	1856 ± 124	811	36.0
$L_{xy} > 200\mu m$	1844 ± 121	703	36.5
$L_{xy} > 250\mu m$	1837 ± 119	636	36.9
$L_{xy} > 290\mu m$	1837 ± 118	589	37.3

The Number of events in the TTT data stream for different cuts on L_{xy} of the B_s candidates

Applying different cuts on L_{xy}

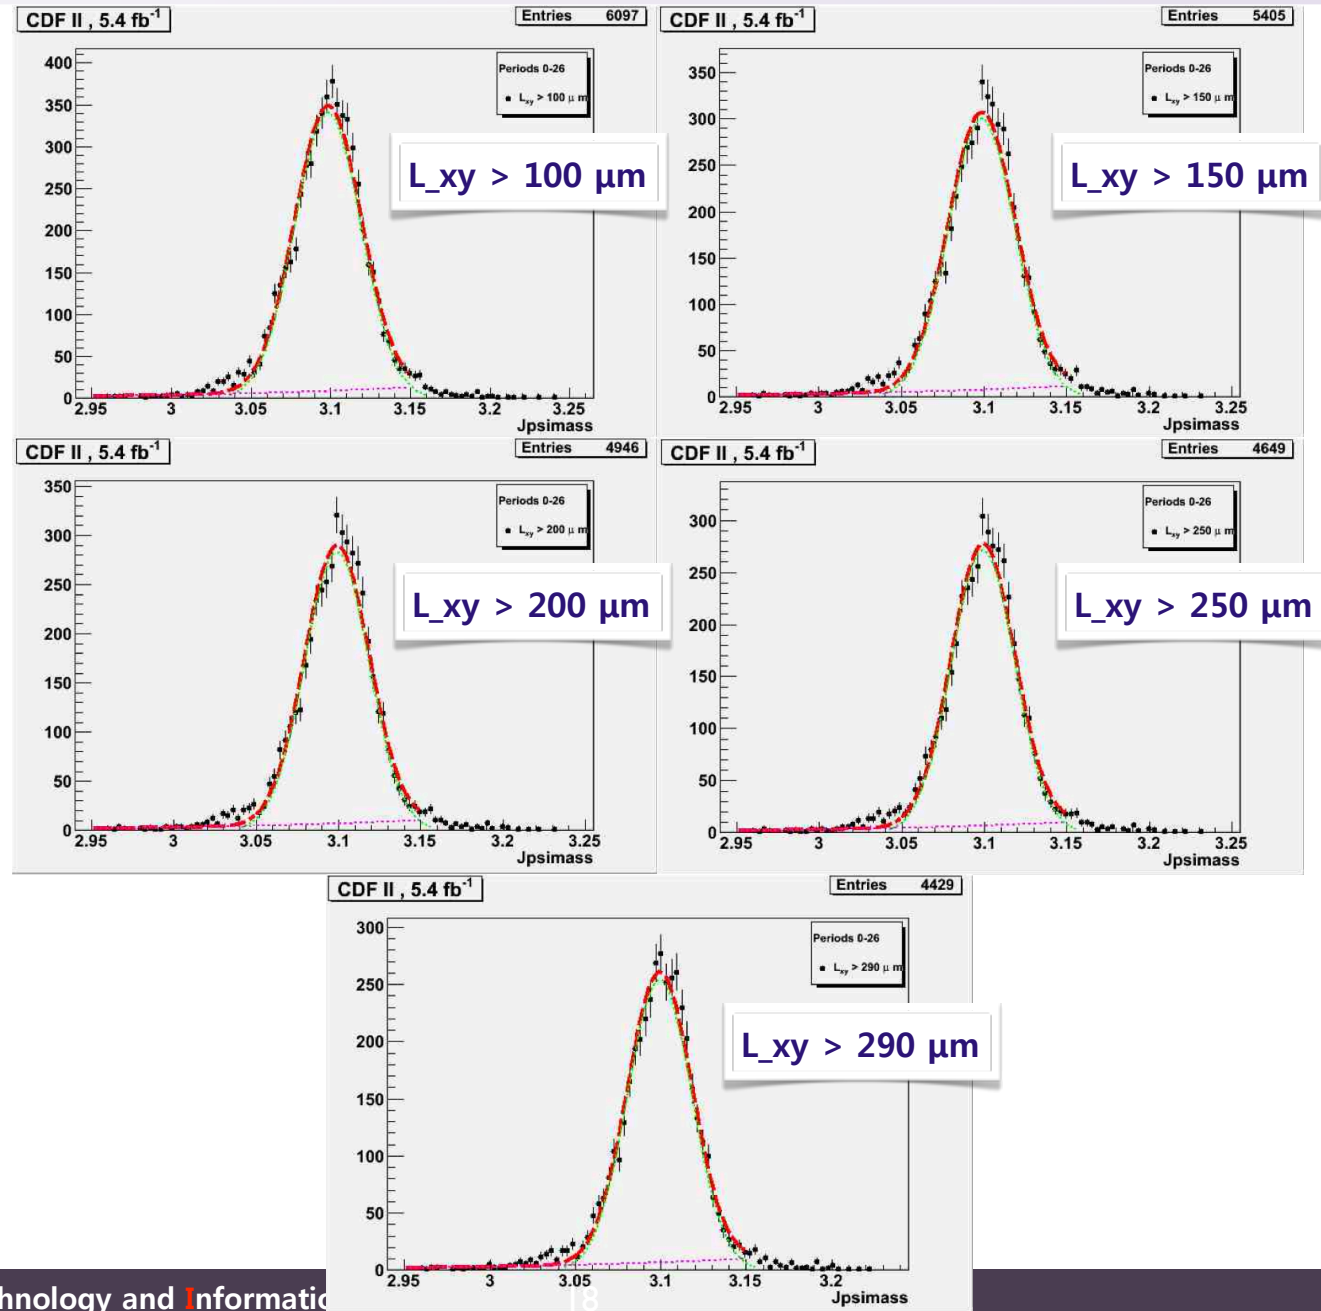

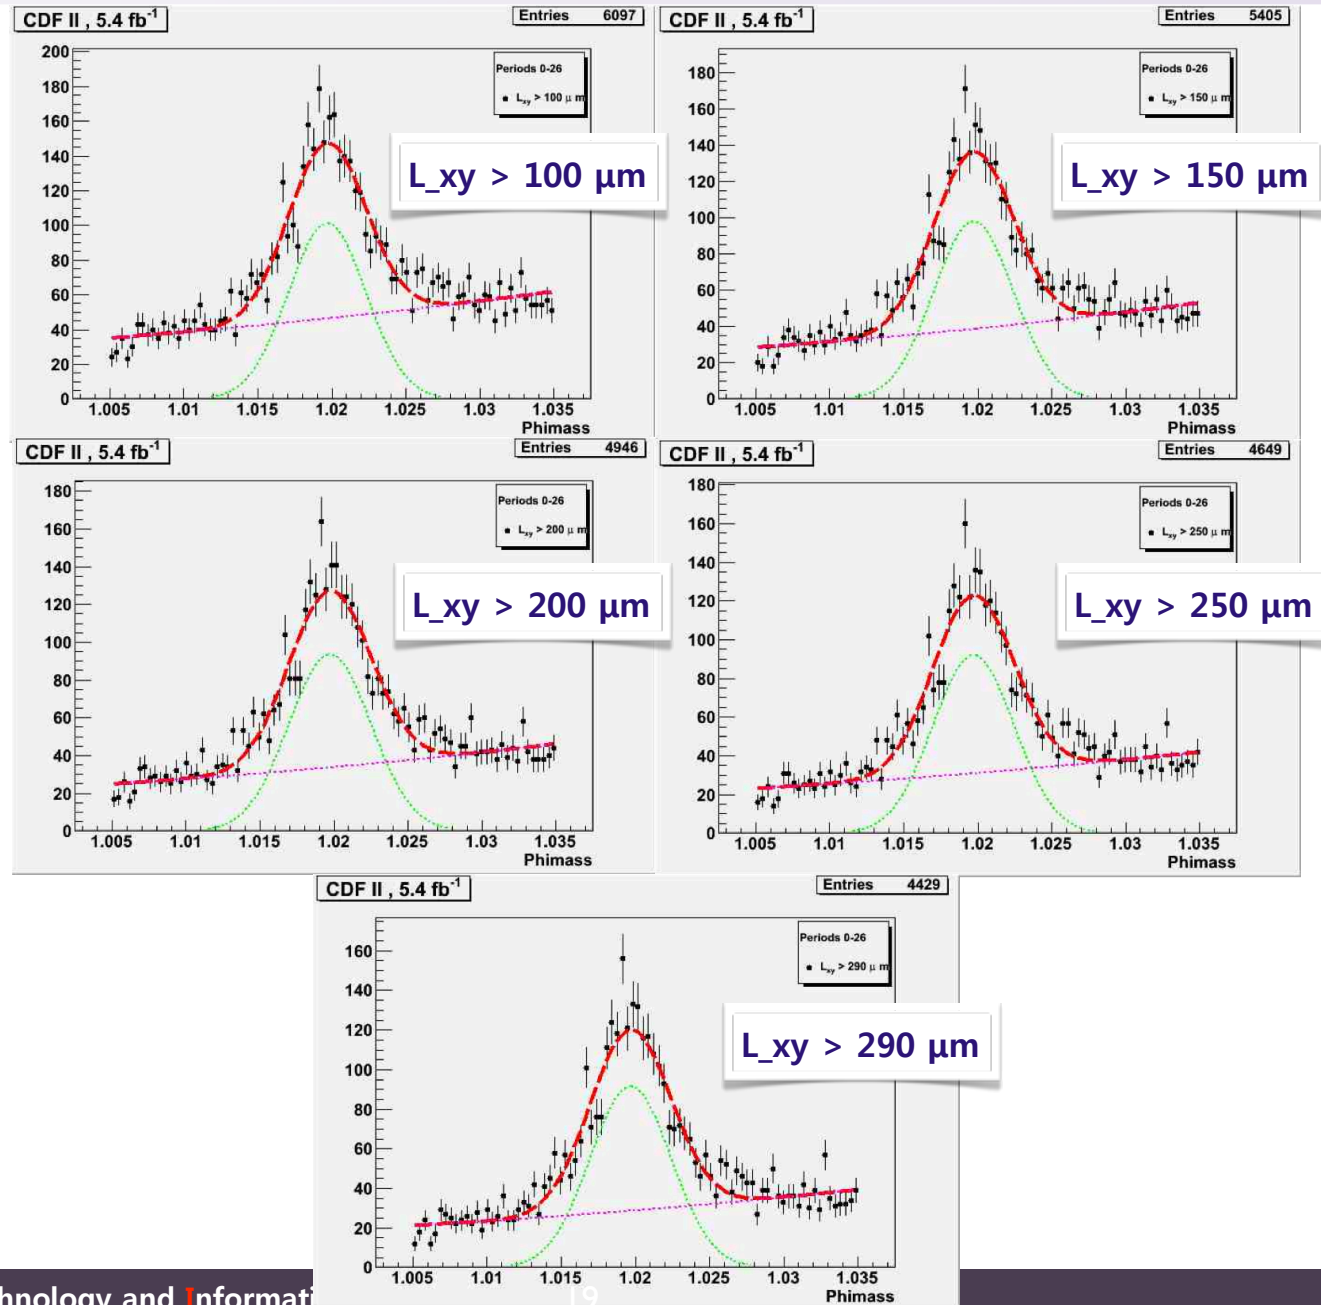

Evolution of signal Vs. background with the applied L_{xy} cut value (period 0-26)

Mass Spectrum of the J/ψ for similar cuts on L_{xy} in the TTT data sample (period 0-26)

Mass Spectrum of the ϕ for similar cuts on L_{xy} in the TTT data sample (period 0-26)

Results

The TTT provides as a signal ($\pm 3\sigma$) a total of 1914 events (excluding overlaps) over a background ($\pm 3\sigma$) of 1690 events, over the full period 0 to 26.

In the same run period we are left with a total of 5932 events from the dimuons.

This meaning that the TTT data are bringing 32.2 % more events to the analysis.
